### 2012 MAY 29 AM 8: 13

2011 Annual Drinking Water Quality Report Strayhorn Water Association PWS#: 690006 &690007 May 2012

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to providing you with information because informed customers are our best allies. Our water source is from wells drawing from the Sparta and Lower Wilcox Aquifers.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identify potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Strayhorn Water Association have received lower rankings in terms of susceptibility to contamination.

If you have any questions about this report or concerning your water utility, please contact Bruce Sinquefield at 662.562.9428. We want our valued customers to be informed about their water utility. If you want to learn more, please join us at any of our regularly scheduled meetings. They are held on the last Monday of the month at 7:00 PM at 7304 Highway 4 West, Senatobia, MS. The annual meeting is held the second Thursday in November at 7:00 PM at the Strayhorn School Cafeteria.

We routinely monitor for constituents in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1st to December 31st, 2011. In cases where monitoring wasn't required in 2011, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides; which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

<sup>\*</sup> Most recent sample. No sample required for 2011.

As you can see by the table, our system had no violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected however the EPA has determined that your water IS SAFE at these levels.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline 1.800.426.4791.

#### \*\*\*\*\*A MESSAGE FROM MSDH CONCERNING RADIOLOGICAL SAMPLING\*\*\*\*\*

In accordance with the Radionuclides Rule, all community public water suppliers were required to sample quarterly for radionuclides beginning January 2007.—December 2007. Your public water supply completed sampling by the scheduled deadline; however, during an audit of the Mississippi State Department of Health Radiological health laboratory, the Environmental Protection Agency (EPA) suspended analyses and reporting of radiological compliance samples and results until further notice. Although this was not the result of inaction by the public water supply, MSDH was required to issue a violation. This is to notify you that as of this date, your water system has not completed the monitoring requirements. The Bureau of Public Water Supply has taken action to ensure that your water system be returned to compliance by March 31, 2013. If you have any questions, please contact Melissa Parker, Deputy Director, Bureau of Public Water Supply, at 601.576.7518.

The Strayhorn Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

#### 2011 Annual Drinking Water Quality Report Strayhorn Water Association PWS#: 690006-8690007 May 2012

## RECEIVED - WATER SUPPLY

Wa're pleased to pleased to pleased to you take year's Annual Quality Water Report. This report is designed to inform you about the pusity water and services we deliver to you every day. Our constant goal is to provide you with a sade and the files by the pusity water the water treatment process. At pone to the choice were make to continually improve the water treatment process. At pone to the choice water resources are commonly ded to providing you with information because informed customers are our best alies. Our water source is from wells drawing from the Sparte and Lower Wilcox Aquifers.

The source water assessment has been completed for our public water system to detarmine the overall susceptibility of its drinking water supply to identify potential sources of confamination. A report confaming detailed information on how the susceptibility water supply to identify potential sources of confamination. A report confaming detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the determination water Association have received lower rankings in terms of susceptibility to contamination.

If you have any questions about this report or concerning your water utility, please contact Bruce Singuefield at 982 562 9428. We want our valued customers to be informed about their water utility. If you want to team more, please join us at any of our regularity scheduled meetings. They are held on the last Monday of the month at 7:00 PM at 7:304 Highway 4 West. Senatoble, MS. The annual meeting is held the second Thursday in November at 7:00 PM at the Strayhorn School Cafeleria.

We routinely monitor for constituents in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1st 10 Becamber 31st, 2011. In cases where monitoring drinking water contaminants that were detected during the period of January 1st 10 Becamber 31st, 2011. In cases where monitoring wasn't required in 2011, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence naturally control in turnan activity, microbial contaminants, such as vities and becters, that may come from sewage (resident) plants of animals or from human activity, microbial contaminants, such as vities and becters, that may come from sewage (resident) plants split systems, agriculture, then storm-water monit, industrial, or domestic wastewater discharges, old and gas production, mining, or result from until material to the storm of the

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms provided the following definitions:

Action Level - the concentration of a contaminant which if exceeded, trippers treatment or other requirements which a water system

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as teasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The 'Goal'(NCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Meximum Residual Disinfectant Level (MRDL) — The highest level of a disinfectant allowed in drinking water. There'ls convincing evidence that addition of a disinfectant is necessary for control naprobal contaminants.

Maximum Residual Disinfectant Level Scal (MRDLS) — The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (opm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Picocuries per liter (pCid.) - picocuries per liter is a measure of the radioactivity in water.

Musi recent comple: No sample required for 2011.

As you can see by the table, our system had no violations. We're proud that your diffixing water meets or exceeds all Federal and State requirements. We have learned intough our monitoring and testing that some constituents have been detected however the EPA has determined that your water IS SAFE at make levels.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant woman and young children, t.ssd in drinking water is primarily from metalass and components associated with service sines and home plumbing. Our water system is responsible for providing legit quality draiking water, but cannot coming the variety of materials used in plumbing components. When minutes before using water for drinking or cooking, if you are concerned about lead in your water, you may wrish to have your water sested, information on seal in draiking or cooking, if you are concerned about lead in your water, you may wrish to have your water brinking. Please contact 801.578,7882 if you wish to have your water tested.

All sources of dinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicats and radioactive substances. All dinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses at health fals, More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Orinking Water Hotine at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population: Immuno-compromised persons such as persons with cancer undergoing, chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and inflamts can be particularly strisk from infloctions. These people should seek advices about drinking water from their teath care providers. EPACDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Sate Drinking Water Holline 1,800,426,4791.

"A MESSAGE FROM MSDH CONCERNING RADIOLOGICAL SAMPLING"

In accordance with the Radionuclidee Rule, all community public water supplies were required to sample quarterly for radionuclides the beginning January 2007 — December 2007. Your public water supply completed sampling by the scheduled deadline, however, during supported analyses and reporting of radiological compliance samples and industrial protection Agency (EPA) of inaction by the public water supply. MSDH was required to issue a violetion. This is to notify you had so of this date, your water system has not completed the monitoring requirements. The Bureau of Public Water Supply has taken a complete that your water system has not complete by March 31: 2013. If you have any questions, please contact Mailses Parker, Deputy, Director, Bureau of Public Water Supply, at 801.578.7518.

The Strayhorn Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.
